WINTER-18 EXAMINATION

**Subject Name: Data Structure using C Model Answer** Subject Code:

22317

#### **Important Instructions to examiners:**

- 1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more Importance (Not applicable for subject English and Communication Skills.
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.
- 7) For programming language papers, credit may be given to any other program based on equivalent concept.

Q. No	Sub Q. N.	Answer	Marking Scheme
1		Attempt any FIVE of the following:	10 M
	a	Define the term algorithm.	2 M
	Ans	Algorithm is a stepwise set of instructions written to perform a specific task.	Correct definition 2M
	b	List any 4 applications of queue.	2 M
	Ans	<ul> <li>In computer system to maintain waiting list for single shared resources such as printer, disk, etc.</li> <li>It is used as buffers on MP3 players, iPod playlist, etc.</li> <li>Used for CPU scheduling in multiprogramming and time sharing systems.</li> <li>In real life, Call Center phone systems will use Queues, to hold people calling them in an order, until a service representative is free.</li> <li>Handling of interrupts in real-time systems.</li> <li>Simulation</li> </ul>	Any four applications-1/2 M each
	С	Describe following terms w.r.to tree:  (i) Leaf node  (ii) Level of node	2 M
	Ans	Example:	Description of each term 1M

	A	Level 0  Level 1						
	_	(i) Leaf node: A node without any child node is called as leaf node.						
	Nodes B and C are leaf node as shown in above example.  (ii) Level of node: Position of a node in the hierarchy of a tree is called as level of node.  Level of node B is 1 as shown in above example.							
d	Differentiate between stack and que	eue.( Any two points)		2 M				
Ans	Stack  1. Stack is a data structure in which insertion and deletion operations are performed at same end.	Queue  1. Queue is a data structure in which insertion and deletion operations are performed at different ends.		Any two correct differences- 1M each				
	2. In stack an element inserted last is deleted first so it is called <b>Last In First Out list.</b>	2. In Queue an element inserted first is deleted first so it is called <b>First In First Out list.</b>						
	3.In stack only one pointer is used called as <b>stack top</b>	3.In Queue two pointers are used called as <b>front</b> and <b>rear</b>						
	4. <b>Example</b> : Stack of books	4. <b>Example</b> : Students standing in a line at fees counter						
	5.Application:	5. Application:						
	<ul><li>Recursion</li><li>Polish notation</li></ul>	<ul> <li>In computer system for organizing processes.</li> <li>In mobile device for sending receiving messages.</li> </ul>						

	6. Representation: Using array 6. Representation: Using array	
	top 13  A B C D  Front Rear	
		2.14
е	Describe undirected graph with suitable example.	2 M
Ans	Undirected graph: A graph in which the edges do not have any direction associated with them is known as undirected graph.  In undirected graph, if an edge exists between two nodes A and B then the nodes can traverse from A to B as well as from B to A. Each edge is bidirectional.  Example:-	Definition- 1M, example- 1M
	In the above example, each edge is bidirectional.	
f		2 M
	In the above example, each edge is bidirectional.	llar Each term definition 1M
	In the above example, each edge is bidirectional.  Define the terms: Linear data structure and non-linear data structure.  Linear Data Structure: A data structure in which all data elements are stored in a particular sequence is known as linear data structure.  Example: stack, queue  Non-Linear data structure: A data structure in which all data elements are not stored in a particular sequence is known as nonlinear data structure.	llar Each term definition 1M
Ans	In the above example, each edge is bidirectional.  Define the terms: Linear data structure and non-linear data structure.  Linear Data Structure: A data structure in which all data elements are stored in a particular sequence is known as linear data structure.  Example: stack, queue  Non-Linear data structure: A data structure in which all data elements are not stored in a particular sequence is known as nonlinear data structure.  Example: graph and tree.  convert infix expression into prefix expression:	llar Each term definition 1M  any  2 M  Correct prefix
Ans	In the above example, each edge is bidirectional.  Define the terms: Linear data structure and non-linear data structure.  Linear Data Structure: A data structure in which all data elements are stored in a particular sequence is known as linear data structure.  Example: stack, queue  Non-Linear data structure: A data structure in which all data elements are not stored in a particular sequence is known as nonlinear data structure.  Example: graph and tree.  convert infix expression into prefix expression:  (A+B)*(C/G)+F  Infix expression Read Stack contents Prefix expression	llar Each term definition 1M  any  2 M  Correct

	(A+B)*(C/G)		+)	F	
		)			
	(A+B)*(C/G	G	+)	GF	
	(A+B)*(C/	/	+)/	GF	
	(A+B)*(C	С	+)/	CGF	
	(A+B)*(	(	+	/CGF	
	(A+B)*	*	+*	/CGF	
	(A+B)	)	+*)	/CGF	
	(A+B	В	+*)	B/CGF	
	( <b>A</b> +	+	+*)+	B/CGF	
	(A	A	+*)+	AB/CGF	
	(	(	+*	+AB/CGF	
				*+AB/CGF	
				+*+AB/CGF	
2	Attempt any THR	EE of the follo	owing:		12 M
a	Describe working	of linear searc	h with example.		4 M
Ans	In linear search, sea	arch element is	compared with each	ch element from the list in a sequence	. Relevant
	Comparison starts comparison reaches			and continues till number is found or	2M, Any
				ne process of searching requires more ere n indicates number of elements in	i examble-
	Linear search on so comparison reaches	•	•	ch takes place till element is found or element.	r
	Example:- Using ar	ray representat	ion		
	Input list 10, 20, 30	, 40, 50 and Se	earch element 30, In	dex =0	
	Iteration 1				
	10 20 30	0 40 50			
	10!=30				

(Autonomous) (ISO/IEC - 27001 - 2013 Certified)

(Autonomous) (ISO/IEC - 27001 - 2013 Certified)

0	d	Differentiate	between general tree and binar	ry tree. (any four points)	4 M			
A	Ans	Sr.	General Tree	Binary Tree	Any four relevant			
		1	A general tree is a data structure in which each node can have infinite number of children	A Binary tree is a data structure in which each node has at most <b>two nodes</b> i.e. left and right	differences -1M each			
		2	In general tree, root has indegree 0 and maximum outdegree n.	In binary tree, root has indegree 0 and maximum outdegree 2.				
		3	In general tree, each <b>node</b> have in-degree <b>one</b> and maximum out-degree <b>n</b> .	in-degree <b>one</b> and maximum out-degree <b>2</b> .				
		4	Height of a general tree is the length of longest path from root to the leaf of tree. Height(T) = {max(height(child1) , height(child2) , height(child-n))+1}	<pre>Height of a binary tree is : Height(T) = { max (Height(Left Child) , Height(Right Child) + 1}</pre>				
		5	Subtree of general tree are not ordered	Subtree of binary tree is <b>ordered</b> .				
		6	General tree	Binary Tree				
			Root	Root				
3		Attempt any	THREE of the following:		12 M			
a	a	Write a C pr	ogram for deletion of an elemen	nt from an array.	4 M			
A	Ans	printf("F scanf("%		/\ <b>n</b> ");	4M for correct logic & program code			
		for (c = scanf( printf("Y scanf("%)	O; c < n; c++) "%d", &array[c]); Enter the location where you wish 6d", &position); ion >= n+1)	n to delete element\ <b>n</b> ");				

### MAHARASHTRA STATE BOARD OF TECHNICAL EDUCATION (Autonomous)

(ISO/IEC - 27001 - 2013 Certified)

```
printf("Deletion not possible.\n");
            else
              for (c = position - 1; c < n - 1; c++)
               array[c] = array[c+1];
             printf("Resultant array:\n");
              for (c = 0; c < n - 1; c++)
               printf("%d\n", array[c]);
            return 0;
      Convert following expression into postfix form. Give stepwise procedure.
                                                                                                  4 M
b
      A+B↑C*(D/E)-F/G.
      Consider input expression as (A+B\uparrow C*(D/E)-F/G)
                                                                                                  Correct
Ans
                                                                                                  Postfix

       A circular linked list is a variation of linked list in which the last element is linked to the
                                                                                                        1M for
       first element. This forms a circular loop.
                                                                                                        diagram
                                                                                                        and 1M for
                                                                                                        any one
                                         Data
                                                              Data
                                                 Next
                    Data
                                                                                                        advantage
       A circular linked list can be either singly linked or doubly linked.
               for singly linked list, next pointer of last item points to the first item
              In doubly linked list, prev pointer of first item points to last item as well.
       We declare the structure for the circular linked list in the same way as follows:
       Struct node
       Int data:
       Struct node *next;
       Typedef struct node *Node;
       Node *start = null;
       Node *last = null;
       For example:
```

6		Attempt any TWO of the following:	12 M
	a	Describe working of selection sort method. Also sort given input list in ascending order using selection sort input list:- 55, 25, 5, 15, 35.	6 M
	Ans	Working of Selection sort: Selection Sort algorithm is used to arrange a list of elements in a particular order (Ascending or Descending). In selection sort, the first element in the list is selected and it is compared repeatedly with remaining all the elements in the list. If any element is smaller than the selected element (for ascending order), then both are swapped. Then we select the element at second position in the list and it is compared with remaining all elements in the list. If any element is smaller than the selected element, then both are swapped. This procedure is repeated till the entire list is sorted.	3marks for description, 3marks for correct solution

С	Describe procedure to delete an element from singly linked list using diagram.	6 M
Ans	In a linear linked list, a node can be deleted from the beginning of list, from in between positions and from end of the list.	**Note: Correct
	Delete a node from the beginning:-	algorithm or program shall be considered.
	Noder Node 2 Hode 3	Any two deletions shall be considered
	Node to be deleted is node1. Create a temporary node as 'temp'. Set 'temp' node with the address of first node. Store address of node 2 in header pointer 'start' and then delete 'temp' pointer with free function. Deleting temp pointer deletes the first node from the list.	3marks each
	OR	
	Step 1: Create temporary node 'temp'.	
	Step 2: Assign address of first node to 'temp' pointer.	
	Step 3: Store address of second node (temp->next) in header pointer 'start'.	
	Step 4: Free temp.	
	Delete a node from in between position:-	

(Autonomous)

(ISO/IEC - 27001 - 2013 Certified)

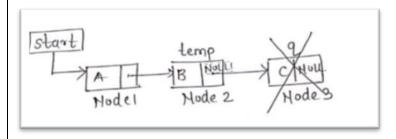

Node to be deleted is node3. Create a temporary node as 'temp' and 'q'. Set 'temp' node with the address of first node. Traverse the list up to the previous node of node 3 and mark the next node (node3) as 'q'. Store address from node 'q' into address field of 'temp' node. Then delete 'q' pointer with free function. Deleting 'q' pointer deletes the node 3 from the list.

#### OR

- Step 1: Create temporary node 'temp', 'q'.
- Step 2: Assign address of first node to 'temp' pointer.
- Step 3: Traverse list up to previous node of node to be deleted.
- Step 4: Mark the node to be deleted 'q'.
- Step 5: Store address from node 'q' in address field of 'temp' node (temp->next=q->next).
- Step 6: Free q.

#### Delete a node from the end:-

Node to be deleted is node 3. Create a temporary node as 'temp' and 'q'. Set 'temp' node with the address of first node. Traverse the list up to the second last node and mark the last node as 'q'. Store NULL value in address field of 'temp' node and then delete 'q' pointer with free function. Deleting q pointer deletes the last node from the list.

#### OR

- Step 1: Create temporary node 'temp', 'q'.
- Step 2: Assign address of first node to 'temp' pointer.
- Step 3: Traverse list upto second last node.
- Step 4: Mark last node's address in node 'q'.
- Step 5: store NULL value in address field of second last node (temp->next).
- Step 6: Free q

#### SUMMER – 2019 EXAMINATION MODEL ANSWER

Subject: Data Structure Using 'C'

Subject Code: 22317

#### **Important Instructions to examiners:**

- 1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more Importance (Not applicable for subject English and Communication Skills).
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.
- 7) For programming language papers, credit may be given to any other program based on equivalent concept.

		<u>-</u> _
	<pre>struct node *q; if(start==NULL) { printf("list is empty\n"); } q=start; printf("list is:\n"); while(q!=NULL) { printf("%d\t",q-&gt;info); q=q-&gt;next; } }</pre>	
(c)	Draw and explain construction of circular queue.	4M
Ans.	A queue, in which the last node is connected back to the first node to	-4141
	form a cycle, is called as circular queue.	
	7 0 Front 10 10 10 1 8	Draw 1M
	The above diagram represents a circular queue using array.	
	It has rear pointer to insert an element and front pointer to delete an element. It works in FIFO manner where first inserted element is deleted first.  Initially front and rear both are initialized to -1 to represent queue empty. First element inserted in circular queue is stored at 0 <sup>th</sup> index position pointed by rear pointer. For the very first element, front pointer is also set to 0 <sup>th</sup> position. Whenever a new element is inserted in a queue rear pointer is incremented by one. If rear is pointing to max-1 and no element is present at 0 <sup>th</sup> position then rear is set to 0 <sup>th</sup> position to continue cycle. Before inserting an element, queue full	Explana tion 3M
	condition is checked. If rear is set to max-1 position and front is set to	
	0 then queue is full. Otherwise if rear =front+1 then also queue is full.

#### SUMMER – 2019 EXAMINATION MODEL ANSWER

**Subject: Data Structure Using 'C'** 

**Subject Code:** 

22317

9. j=8,i-1 since a[j] > pivot do nothing array will remain same	9.	j=8, i-1	since a[j] >	pivot do	nothing	array will	remain	same
---	----	----------	--------------	----------	---------	------------	--------	------

Array elements	2	3	6	22	50	39	49	25	18	5
indexes	0	1	2	3	4	5	6	7	8	9

We come out of loop because j is now equal to high-1.

### Finally we place pivot at correct position by swapping a[i+1] and a[h] (or pivot)

 $a[] = \{2,3,5,22,50,39,49,25,18,6\} // 6 \text{ and } 5 \text{ Swapped}$ 

Now, **5**is at its correct place. All elements smaller than 5 are before it and all elements greater than 5 are afterit.

Similarly rest of the passes will be executed and will provide the following output

Output of pass1

Array elements	2	3	5	22	50	39	49	25	18	6
indexes	0	1	2	3	4	5	6	7	8	9

#### Pass2

 $A = \{2.3\} \text{ pivot} = 3$ 

LJ (-,-)			
Array elements	2	3	5
indexes	0	1	2

 $a[]={22,50,39,49,25,18,6}$ pivot=6

Array elements	6	50	39	49	25	18	22
indexes	3	4	5	6	7	8	9

 $a[]={50,39,49,25,18,22}$ pivot=22

Array elements	18	22	49	25	50	39
indexes	4	5	6	7	8	9

## SUMMER – 2019 EXAMINATION MODEL ANSWER

	(c)	Write an algorithm to count number of nodes in singly linked list.	6M
	Ans.	Let	
		start is pointer variable which always stores address of first node in	
		single linked list. If single linked list is empty then start will point to	
		NULL.	
		q is pointer variable used to store address of nodes in single linked	<b>a</b> .
		list.	Correct
		Step 1: Start	algorith m 6M
		Step 2: [Assign starting address of single linked list to pointer q] q=start	m ow
		Step 3: [ Initially set count of nodes in Linked list as zero ] count=0	
		Step 4: [ Check if Linked list empty or not]	
		if start==NULL	
		Display "Empty Linked List"	
		go to step 6.	
		Step 5: [ Count number of nodes in single linked list ]	
		while q!=NULL	
		count++ and	
		q=q->next;	
		Step 6: Display count (total number of nodes in single linked list)	
		Step 7: stop	
6.		Attempt any TWO of the following:	12
	(a)	Sort the following numbers in ascending order using Bubble sort.	<b>6M</b>
		Given numbers: 29, 35, 3, 8, 11, 15, 56, 12, 1, 4, 85, 5 & write the	
		output after each interaction.	
	Ans.	Pass 1	
		Enter no of elements :12	
		Enter array elements :29 35 3 8 11 15 56 12 1 4 85 5	
		Unsorted Data: 29 35 3 8 11 15 56 12 1 4 85 5

#### Winter - 19 EXAMINATION

Subject Name: Data Structure Using 'C' Model Answer Subject Code: 22317

## **Important Instructions to examiners:**

- 1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more Importance (Not applicable for subject English and Communication Skills.
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.
- 7) For programming language papers, credit may be given to any other program based on equivalent concept.

Q.	Sub	Answer	Marking
No.	Q.		Scheme
	N.		
1.		Attempt any Five of the following:	10M
	а	Write any four operations that can be performed on data structure.	2M
	Ans	1. Data structure operations (Non Primitive)	2 M for any 4
		<b>2. Inserting:</b> Adding a new data in the data structure is referred as insertion.	Operation
		<b>3. Deleting:</b> Removing a data from the data structure is referred as deletion.	
		<b>4. Sorting:</b> Arranging the data in some logical order (ascending or descending, numerically or alphabetically).	
		<b>5. Searching:</b> Finding the location of data within the data structure which satisfy the searching condition.	
		<b>6. Traversing:</b> Accessing each data exactly once in the data structure so that each data item is traversed or visited.	
		<b>7. Merging:</b> Combining the data of two different sorted files into a single sorted file.	
		<b>8.</b> Copying: Copying the contents of one data structure to another.	
		<ul><li>9. Concatenation: Combining the data from two or more data structure.</li><li>OR</li></ul>	

	Data structure operations (Primitive)	
	Creation: To create new Data Structure	
	2. Destroy: To delete Data Structure	
	3. Selection: To access (select) data from the data structure	
	4. Updating: To edit or change the data within the data structure.	
b	Define the term overflow and underflow with respect to stack.	2M
Ans	Stack overflow: When a stack is full and push operation is performed to insert a new element, stack is said to be in overflow state.  Max = 4  B  C  B  C  B  C  B  C  B  C  C  B  C  C	1 M for stack overflow and 1M for stack underflow
	Stack underflow: When there is no element in a stack (stack empty) and pop operation is called then stack is said to underflow state.  Max = 4  3  Max = 4	
	2   2   0   0   0   0   0   0   0   0	
С	Stack Emply. Stack underflow state:	2M

elements are deleted from the queue, new elements cannot be added in their place in the queue, i.e. the position cannot be reused. After rear reaches the last position, i.e. MAX-1 in order to reuse the vacant positions, we can bring rear back to the 0th position, if it is empty, and continue incrementing rear in same manner as earlier. Thus rear will have to be incremented circularly. For deletion, front will also have to be incremented circularly. Rear can be incremented circularly by the following code. If ((rear == MAX-1) and (front !=0) Rear =0; Else Rear= rear +1; Example: Assuming that the queue contains three elements. Now we insert an element F at the beginning by bringing rear to the first position in the queue, this can be represented circularly as shown. Front 10 20 30 50 40 3 **Need of Circular Queue:** Circular queues overcome the problem of unutilized space in linear queue implemented as an array.

The element can be stored efficiently in an array so as to wrap around so that the end of queue is followed by front of the queue.

		printf("\n Sum = %d ", sum)	1	t <sub>7</sub>						
		Total computational ti T=n(t4+t5+t6)+(t1+t6) For large n, T can be T=n(t4+t5+t6)=kn w Thus $T=kn$ or	t2+t3+t4 approx	4+t7) imated to	+nt6+nt5+t7					

(Autonomous) (ISO/IEC - 27001 - 2013 Certified)

**Space Complexity:** Total amount of computer memory required by an algorithm to complete its execution is called as space complexity of that algorithm. When a program is under execution it uses the computer memory for THREE reasons. They are as follows...

- Instruction Space: It is the amount of memory used to store compiled version of instructions.
- Environmental Stack: It is the amount of memory used to store information of partially executed functions at the time of function call.
- Data Space: It is the amount of memory used to store all the variables and constants.

If the amount of space required by an algorithm is increased with the increase of input value, then that space complexity is said to be Linear Space Complexity.

#### **Example**:

```
int sum(int A[], int n) 
 { 
  int sum = 0, i; 
  for(i = 0; i < n; i++) 
    sum = sum + A[i]; 
  return sum;}
```

In the above piece of code it requires

'n\*2' bytes of memory to store array variable 'a[]'

2 bytes of memory for integer parameter 'n'

4 bytes of memory for local integer variables 'sum' and 'i' (2 bytes each)

2 bytes of memory for return value.

That means, totally it requires '2n+8' bytes of memory to complete its execution. Here, the total amount of memory required depends on the value of 'n'. As 'n' value increases the space required also increases proportionately. This type of space complexity is said to be **Linear Space Complexity**.

OR

**Time complexity**:- Time complexity of a program/algorithm is the amount of computer time that it needs to run to completion. While calculating time complexity, we develop frequency count for all key statements which are important and basic instructions of an algorithm.

Example: Consider three algorithms given below:-

	Algorithm A: - a=a+1	
	Algorithm B: - for $x = 1$ to n step 1 a=a+1	
	Loop	
	Algorithm C:- for x=1 to n step 1	
	for y=1 to n step 1 a=a+1	
	Loop	
	Frequency count for algorithm A is 1 as a=a+1 statement will execute only once. Frequency count for algorithm B is n as a=a+1 is key statement executes n time as the loop runs n times.	
	Frequency count for algorithm C is n as a=a+1 is key statement executes n2 time as the inner loop runs n times, each time the outer loop runs and the outer loop also runs for n times.	
	<b>Space complexity</b> :- Space complexity of a program/algorithm is the amount of memory that it needs to run to completion. The space needed by the program is the sum of the following components:-	
	<b>Fixed space requirements</b> : - It includes space for instructions, for simple variables, fixed size structured variables and constants.	
	Variable time requirements: - It consists of space needed by structured variables whose size depends on particular instance of variables. Example: - additional space required when function uses recursion.

b	Explain the concept of recursion using stack.	<b>6M</b>
Ans	body contains a function call statement that calls itself repetitively.	Explanation- 4M & 2M fo Example
	Example:	
	function call from main(): fact(n); // consider n=5	
	Function definition:	
	int fact(int n)	
	if(n==1)	
	return 1; else	
	return(n*fact(n-1));	
	In the above recursive function a function call fact (n-1) makes a recursive	
	call to fact function. Each time when a function makes a call to itself, it save	
	its current status in stack and then executes next function call. When fact ( )	
	function is called from main function, it initializes n with 5. Return statement inside function body executes a recursive function call. In this call, first	
	value of n is stored using push ( ) operation in stack (n=5) and a function is	
	called again with value 4(n-1). In each call, value of n is push into the stack	
	and then it is reduce by 1 to send it as argument to recursive call. When a	
	function is called with n=1, recursive process stops. At the end all values	
	from stack are retrieved one by one using pop ( ) operation to perform multiplication to calculate factorial of number.	
	multiplication to calculate factorial of number.	
	f(1) POP true return 1;	
	f(2) f(2) f(2) pop false return 2*f(1) return 2*1	
	f(3) f(3) f(3) pop false false	
	return 3*f(2) return 3*f(2) return 3*2	
	f(4)	
	f(5)   f(	

	recursive call execution. Next columns shows result of pop operation for	
	calculating factorial.	
С	Show with suitable diagrams how to delete a node from singly linked list at the beginning, in between and at the end of the list.	6M
Ans	In a linear linked list, a node can be deleted from the beginning of list, from in between positions and from end of the list.  Delete a node from the beginning:-	Diagram for beginning- 2M, end-2M, inbetween-2M
	Start temp 1  A C HULL  Mode Node 2 Hode 3	
	Node to be deleted is node1. Create a temporary node as 'temp'. Set 'temp' node with the address of first node. Store address of node 2 in header pointer 'start' and then delete 'temp' pointer with free function. Deleting temp pointer deletes the first node from the list.  Delete a node from in between position:-	
	Start  Temp, 9  Node 1 Hode 2 Mode 3 Hode 4	
	Node to be deleted is node3. Create a temporary node as 'temp' and 'q'. Set 'temp' node with the address of first node. Traverse the list up to the previous node of node 3 and mark the next node (node3) as 'q'. Store address from node 'q' into address field of 'temp' node. Then delete 'q' pointer with free function. Deleting 'q' pointer deletes the node 3 from the list.	

(Autonomous) (ISO/IEC - 27001 - 2013 Certified)

## Delete a node from the end:-

Node to be deleted is node 3.Create a temporary node as 'temp' and 'q'. Set 'temp' node with the address of first node. Traverse the list up to the second last node and mark the last node as 'q'. Store NULL value in address field of 'temp' node and then delete 'q' pointer with free function. Deleting q pointer deletes the last node from the list.
